

end mill cutter

Wachs Subsea has developed a series of machine solutions that utilize End Mill cutting technology, as opposed to standard single point and slitting saw type cutters. Much of the subsea cutting being done is on pipe that is under some type of compressive stress. This may cause pinching or binding if using conventional cutting tools. The Wachs End Mill attachment is able to cut its way out of most of these situations. The End Mill solution can be “On Demand Engineered” to meet many applications including radial and longitudinal cutting, window cutting, wedding caking and other subsea applications.
